Narrative

Case narrative

The below report was received by health authority Medicines and Healthcare Products Reg. Agency MHRA (reference number: GB-TILLOMEDPR-2025-EPL-004486) on 25-SEP-2025. The most recent information was received on 23-OCT-2025. This spontaneous case was originally reported by a healthcare professional and describes the occurrence of ENDOTRACHEAL INTUBATION ("Endotracheal intubation"), MECHANICAL VENTILATION ("Mechanical ventilation") and STEVENS-JOHNSON SYNDROME ("Stevens-Johnson syndrome") in a 22 year-old female patient who received CanesOral Combi 1 Day capsule (batch no. unknown) for Fungal infection. Co-suspect products included Canesoral combi pak for Fungal infection, Diclofenac (batch no. not available) for Pain as well as Pantoprazole (batch no. not available) for Gastrooesophageal reflux disease. CONCURRENT CONDITIONS were listed as Pain, Fungal infection and Gastrooesophageal reflux disease. CONCOMITANT PRODUCTS included FUSIDIC ACID (Fusidic Acid), METHYLPHENIDATE (Methylphenidate), LEVOTHYROXINE (Levothyroxine), FLUTICASONE (Fluticasone) and Drospirenone and ethinyl estradiol (Drospirenone, Ethinylestradiol). On an unknown date, the patient started CanesOral Combi 1 Day (oral) 150 mg daily. The drug was additionally given at the same dose on an unknown date. On an unknown date, the patient started Pantoprazole (oral) 40 mg daily over 6 days. On an unknown date, the patient started Diclofenac (oral) 100 mg daily over 6 days. The drug was additionally given on unknown dates at an unspecified dose and frequency. On an unknown date, the patient started Canesoral combi pak (oral) 150 mg daily. The drug was additionally given at the same dose on an unknown date. On unknown dates she experienced STEVENS-JOHNSON SYNDROME (seriousness criteria life-threatening and medically important) and underwent ENDOTRACHEAL INTUBATION (seriousness criteria life-threatening and medically important) and MECHANICAL VENTILATION (seriousness criteria life-threatening and medically important). It was unknown whether any action was taken with CanesOral Combi 1 Day. At the time of the report, all of the events had resolved with sequelae. The reporter considered ENDOTRACHEAL INTUBATION, MECHANICAL VENTILATION and STEVENS-JOHNSON SYNDROME to be related to CanesOral Combi 1 Day administration. The reporter commented: The causality is assessed as possible for the events of endotracheal intubation, mechanical ventilation and Stevens-Johnson syndrome with pantoprazole and fluconazole. Concurrent use of diclofenac could confound the causal role for the events. However, lack of information regarding event and medical history of

Reporter's comments

patient precludes further meaningful medical assessment.FU (09Oct2025): Reporter's comment in this follow-up contains the same information as previous reporter's comment. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): Body weight was reported to be 70 kg. The most recent follow-up information incorporated above includes data received on:23-OCT-2025: New co suspect 'Canesoral combi pak' was added. 23-OCT-2025: No new information was received.
